PROGRESS REPORT

- **What was achieved last week?**

  What I was able to achieve was that I started mapping out what would be the required pages for this system to work, what is the use of each page, and what are the expected elements in this page for it to work smoothly.

- **What is the focus of today?**

  During the week, I was able to create the models that would be used in the Web Api. Aside from that, also started the initial Database Context and prepared for the initial migration of the database.

- **What blockers exist?**

  Not many blockers really existed in making the project. However, progress has honestly been slow as focus has also been divided among other courses preparing for midterms.

- **What went well?**

  The initial part of the backend actually started coming together, especially as I was able to do the first migration.

- **What didn't go well?**

  I have had a lot to think about after today's session. I realized many things that I have missed while making the project. In fact, as the one in charge of the backend, I realized I was creating the project in the wrong project solution. Aside from that, I realized I had to redo steps as it would better practice on how the creation of the API would actually go.

- **What should we start doing?**

  Today's session was actually really helpful as it helped me open my eyes for new techniques, better practices in making the API, as well as better and more proper designation of tasks. For my part, I will begin from scratch from the template taught during the session, applying from my previous attempt to this new project but better.

- **What we should stop doing?**

  I realized that focusing too much on the wireframe, the instructions I gave to the designers of the front end, was not a good practice. We should stop focusing merely on design and really on the functionality of this system.

- **What we should continue doing?**

  We were able to generate a good idea on how the system should work and how the user (student and teacher) would have different UIs. What's important now is how to properly approach this project and what important elements should be prioritized in order to create a good Attendance System.
